SENIOR SALESFORCE DEVELOPER / SALESFORCE ARCHITECT | SALESFORCE CPQ & QUOTE-TO-CASH | QCP JAVASCRIPT, APEX, LWC, FLOW

SUMMARY

Salesforce professional with 5+ years across Salesforce testing and development, including 4+ years of hands-on development. Deep expertise in Salesforce CPQ, QCP JavaScript, amendment-heavy architectures, and finance-critical Quote-to-Cash calculations. Reduced ACV gross-absolute correction dollars by 82% and QR manual intervention from 11.8% to 5.3% on reviewed deals. Leads technical design, code review, testing standards, and cross-functional problem solving within an enterprise Salesforce environment supporting 5,000–6,000 users.

SKILLS

Salesforce CPQ (SteelBrick) | Quote-to-Cash | Quote Calculator Plugin (QCP) | JavaScript | Apex | Lightning Web Components (LWC) | Flow | SOQL | Salesforce CLI | Git | Cancel & Replace | ACV & Quota Relief Calculations | Revenue & Forecasting | Amendments & Renewals | Pricing & Proration | Technical Design | Code Review | Backward-Compatible Architecture | Salesforce Testing | New Business Testing | RevOps | FP&A | Crediting | Renewals

EXPERIENCE

Salesforce Developer — Qualtrics | *March 2022 – Present*

Promoted to L4, March 2024

Enterprise Salesforce environment with approximately 5,000–6,000 users, $2–3 billion in annual revenue, about 80,000 closed deals each year, and global currencies.

Salesforce CPQ Implementation | March 2022 – 2025

- Took ownership of QCP JavaScript and related Salesforce CPQ automation after consultants completed their engagement during the 2023 implementation; became a primary debugger for complex amendment issues involving pricing, subscriptions, validations, ACV, and quota relief.
- Designed a calculate-time QCP synchronization solution after identifying limits in Salesforce CPQ twinning for amendments and renewals, avoiding a risky historical-data rewrite and the need to disable organization-wide CPQ and Apex triggers.
- Built the QCP approach so product-data changes could flow into active quote processing without rewriting historical records, supporting faster updates to product rules, pricing behavior, policies, and sales incentives.
- Expanded testing standards to cover New Business, Amendment, and Renewal scenarios for price rules and custom automations; moved calculated-field updates from asynchronous Apex jobs into QCP JavaScript so values refreshed during quote calculation.
- Took ownership of Revenue, ACV, quota-relief, and forecasting accuracy after the March 2024 L4 promotion, supporting Crediting and Renewals at the deal level and RevOps and FP&A for company and quarterly reporting.
- Built a feedback process around authorized Crediting and Renewals corrections; reviewed adjustment patterns, identified root causes, and turned high-volume issues into lasting system fixes.
- Served as lead developer for a 2025 move from usage-based to subscription-based pricing with variable proration; drove technical discussions, analyzed manual Crediting adjustments, and converted recurring issues into development work.
- Brought reviewed larger-dollar deals to Q3 2025 adjustment levels of 2.8% for ACV against a 3% cutoff and 5.3% for quota relief against a 5% cutoff.
- Reduced ACV gross-absolute Crediting corrections by 82%, from $485.5M in Q4 2024 to $87.2M in Q3 2025, while reducing QR manual intervention on reviewed deals from 11.8% to 5.3%.

Quote-to-Cash Overhaul | *2025 – Present*

- Shifted from primarily individual development work into technical design and code review across internal developers and contractor teams supporting a major Quote-to-Cash program.
- Provided technical design and review across 2 Qualtrics developers, 5 contractors supporting Qualtrics capacity, and more than 10 contractors assigned directly to the program.

- Designed contract-based ACV and quota-relief calculations for a $10M+ Deloitte-led Quote-to-Cash program, correcting cases where amendments changed the effective contract term used in financial calculations.
- Built one backward-compatible calculation engine for legacy and new data, avoiding a large historical-data rewrite and the long-term cost of maintaining separate calculation methods.
- Balanced current requirements with historical contract behavior so new Quote-to-Cash processes could scale without breaking older amendment and renewal data.
- Delivered the ACV and quota-relief calculation work for the May 2026 go-live; post-launch requests centered on deal-processing improvements rather than correction of the core calculation methodology.

Software Test Engineer — Qualtrics | *March 2021 – March 2022*

- Tested Salesforce changes against stated business requirements and implied platform requirements that could affect users after deployment, helping improve stakeholder acceptance.
- Managed stakeholder clarification and follow-up so other testers could remain focused on test execution rather than repeated requirement discussions.
- Documented repeatable test steps for existing and new Salesforce development, creating a stronger foundation for future test automation in an environment with limited prior documentation.
- Built broad knowledge of Salesforce behavior and organization-wide automation that supported the later transition into Salesforce development.

Product Specialist — Qualtrics | *November 2019 – March 2021*

- Provided client-facing support for the Qualtrics XM and 360 platforms while maintaining a consistent 4.8/5 customer review score compared with a 4.5 average.
- Built a configuration-based survey-protection alternative when standard bot-detection controls did not meet certain client needs, including IP-restricted survey responses without requiring a code change.

EDUCATION

Bachelor of Science in Materials Science and Engineering — Georgia Institute of Technology
Minor in Physics | Highest Honors | *May 2019*
Undergraduate Research, Computational NanoBio Tech Lab: four research papers, including one as first author; presented research on micelle reactant transport at AIChE.
